SUMMARY

Fortinet has published information on vulnerabilities in FORTIOS. This advisory lists the related Siemens Industrial products.

Siemens is preparing updates and recommends specific countermeasures for products where updates are not, or not yet available. Siemens recommends to consult and implement the workarounds provided in Fortinet's upstream security notifications.

AFFECTED PRODUCTS AND SOLUTION

Affected Product and Versions	Remediation
RUGGEDCOM APE1808: All versions with Fortinet NGFW affected by CVE-2023-38545 , CVE-2023-38546 , CVE-2023-41677 , CVE-2023-44250 , CVE-2023-44487 , CVE-2023-46717 , CVE-2023-47537 , CVE-2023-48784 , CVE-2024-21762 , CVE-2024-23112 , CVE-2024-23113 , CVE-2024-23662	Update Fortigate NGFW to V7.4.3. Contact customer support to receive patch and update information. See further recommendations from section Workarounds and Mitigations
RUGGEDCOM APE1808: All versions with Fortinet NGFW with captive portal enabled affected by CVE-2023-42789 , CVE-2023-42790	Update Fortigate NGFW to V7.4.3. Contact customer support to receive patch and update information. See further recommendations from section Workarounds and Mitigations

WORKAROUNDS AND MITIGATIONS

Siemens has identified the following specific workarounds and mitigations that customers can apply to reduce the risk:

- CVE-2023-42789, CVE-2023-42790: Set a non form-based authentication scheme (see <https://fortiguard.fortinet.com/psirt/FG-IR-23-328>)
- CVE-2024-21762: Disable SSL VPN (disable webmode is NOT a valid workaround) (see <https://www.fortiguard.com/psirt/FG-IR-24-015>)
- CVE-2024-23113: For each interface, remove the fgfm access (see <https://www.fortiguard.com/psirt/FG-IR-24-029>)

Product-specific remediations or mitigations can be found in the section [Affected Products and Solution](#). Please follow the [General Security Recommendations](#).

GENERAL SECURITY RECOMMENDATIONS

As a general security measure, Siemens strongly recommends to protect network access to devices with appropriate mechanisms. In order to operate the devices in a protected IT environment, Siemens recommends to configure the environment according to Siemens' operational guidelines for Industrial Security (Download: <https://www.siemens.com/cert/operational-guidelines-industrial-security>), and to follow the recommendations in the product manuals. Additional information on Industrial Security by Siemens can be found at: <https://www.siemens.com/industrialsecurity>

PRODUCT DESCRIPTION

The RUGGEDCOM APE1808 is a powerful utility-grade application hosting platform that lets you deploy a range of commercially available applications for edge computing and cybersecurity in harsh, industrial environments.

VULNERABILITY DESCRIPTION

This chapter describes all vulnerabilities (CVE-IDs) addressed in this security advisory. Wherever applicable, it also documents the product-specific impact of the individual vulnerabilities.

Vulnerability CVE-2023-38545

A heap-based buffer overflow vulnerability in the SOCKS5 proxy handshake in the Curl package. If Curl is unable to resolve the address itself, it passes the hostname to the SOCKS5 proxy. However, the maximum length of the hostname that can be passed is 255 bytes. If the hostname is longer, then Curl switches to the local name resolving and passes the resolved address only to the proxy. The local variable that instructs Curl to "let the host resolve the name" could obtain the wrong value during a slow SOCKS5 handshake, resulting in the too-long hostname being copied to the target buffer instead of the resolved address, which was not the intended behavior.

Vulnerability CVE-2023-38546

This flaw allows an attacker to insert cookies at will into a running program using libcurl, if the specific series of conditions are met.

libcurl performs transfers. In its API, an application creates "easy handles" that are the individual handles for single transfers.

libcurl provides a function call that duplicates an easy handle called [curl_easy_duphandle](#).

If a transfer has cookies enabled when the handle is duplicated, the cookie-enable state is also cloned - but without cloning the actual cookies. If the source handle did not read any cookies from a specific file on disk, the cloned version of the handle would instead store the file name as `none` (using the four ASCII letters, no quotes).

Subsequent use of the cloned handle that does not explicitly set a source to load cookies from would then inadvertently load cookies from a file named `none` - if such a file exists and is readable in the current directory of the program using libcurl. And if using the correct file format of course.
